

# SCUBA TANK VISUAL INSPECTION LIGHT

## NEW & IMPROVED LED MODEL #42095

Global Mfg. Corp. has replaced the incandescent lighting system used in our scuba Tank Visual Inspection Light for many years with a new, high tech LED array mounted on a narrow, very flexible plastic plate. These LED devices offer some very significant improvements over the former bulbs...

1. LED's output extremely high intensity white light at many times the luminosity of incandescent bulbs.
2. LED's have a very long life expectancy.
3. LED's output "cold light" that has almost no heat component, thus eliminating premature failures from prolonged overheating or the melting of glue seals or container tubes.
3. Single bulb failures will NOT cause the entire array to fail or greatly diminish the light output.
4. Because the LED array is mounted on a single-sided, flat plate, the light intensity within the tank can be adjusted by simply rotating the wand.
5. The light array wand is highly flexible and can be "bent" or "formed" for special applications.
6. The narrow wand will fit into all common SCUBA, SCBA, and industrial gas cylinders
